
POWERBI DASHBOARD

Name – Jafar Abbas Syed

This project is an interactive **Power BI dashboard** developed to analyze crime-related data from a forensic investigation perspective. It provides insights into **crime cases, victims, suspects, offense types, evidence, gender distribution, crime severity, and case-related patterns**.

The dashboard uses data transformation, data modeling, **DAX measures**, filters, slicers, and interactive visualizations to convert raw crime data into meaningful analytical information. It allows users to explore relationships between different crime attributes and compare patterns among victims, suspects, offenses, and evidence.

The main objective of the project is to provide a **centralized and interactive platform for crime-data analysis**, helping users understand crime patterns and investigation-related information more efficiently.
